1.3 Reduction of Internal Clearance

1.4 Designation System

1. Adapter Sleeves

ABS adapter sleeves are made of steel, which means they have a tensile strength at least of 430 N/mm², they are easy to install with no requirement of additional location on the shaft. They are used for locating bearings with a tapered bore placed onto a cylindrical seat. They can be used on plain shafts and stepped shafts as well.

Dimension standards for inch series are ANSI/ABMA Std. 8.2. For metric series ISO 2982-1, except for the bore diameter of sleeves shaft in inches.

The radial runout of the Shafts is according to IT5/2 – ISO 1101, and the tolerance for the shafts is h9. The tolerances are for bore type dimension as JS9 and for shafts type dimension as h15 for both series.

The Thread Standards in accordance with ISO 965-3 for metric thread and being for the Bore Diameter < 200 mm. For Bore Diameter ≥ 200 mm being as metric trapezoidal thread in accordance with ISO 2903.

For inch series and Bore diameter ≤ 12 in. according to Unified Special Form ANSI/ASME B1.1. For Bore Diameter ≥ 12 7/16 in. in accordance with ACME thread class 3G.

The Bore tolerances before sleeves splitting is JS9 at a 1:12 taper and JS7 at 1:30 taper.

1.1 Designs and Variants

Adapter Sleeves

Adapters are made up of adapter sleeves, nuts, and washers or clasps. These adapters are used to mount tapered bore bearings easily on specific positions of shafts.

Withdrawal Sleeves

Withdrawal sleeves are used to mount tapered bore bearings on shafts. Withdrawal sleeve nuts are used when removing bearing from shafts.

Locknuts, Nuts

Locknuts are used with adapters, withdrawal sleeves and shafts. Nuts are used with withdrawal sleeves and shafts.

1.1 Designs and Variants

1. Adapter Sleeves

Lock Plates

Lockplates are placed to stop large nuts from rotating.

Precision Nuts

Precision Nuts are used in bearings fixation in machinery and equipment that require high precision. They have shaft tightened and angularly distributed three brass pins around its circumference.

Hydraulic Adapters

Hydraulic adapters feature an oil inlet and oil groove in the sleeve, which make installation to and removal from the shaft easier, particularly with large bearing.

Hydraulic Withdrawal

Hydraulic withdrawal sleeves feature an oil inlet and oil groove in the sleeve, which make mounting to the shaft and disassembly easier, particularly with large bearings.

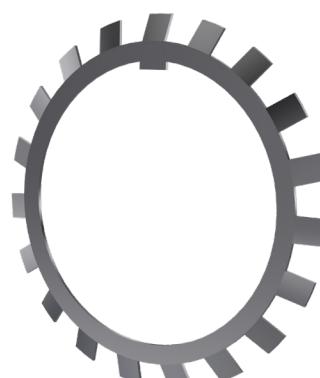

Hydraulic Nuts

Mounting & Dismounting Tools for Rolling Bearings)
Using hydraulic nuts for mounting and dismounting bearings prevents excessive force being applied, so as to avoid damage to shafts and bearings. The force applied is also uniform for more efficient work.

Lock Washers

Lockwashers are placed to stop nuts from rotating.

1.2 Mounting and Dismounting

Usually, the bearing slides over the tapered shaft without any lubrication.

At the time of assembling having an adapter sleeve, a lubrication method can be used between the contact surfaces of the sleeve and the inner bearing ring, also between the sleeve and shaft to minimize the installation required forces. This is applicable at the time of dismounting the parts as well.

Tapered-bore bearings are mounted directly on the shaft or journal, or also by an adapter sleeve or withdrawal sleeve on the cylindrical shaft.

Internal clearance is established either by measuring axial displacement using a dial indicator, or by conventional methods using a thickness gauge.

1.3 Reduction of Radial Internal Clearance

When the bearing is forced on installation on the tapered seat, there is a radial internal reduction due to the expansion taking place in the inner ring.

The radial internal clearance reduction can be used as an indicator of the tight fit of the bearing. These measurements are done by a thickness gauge.

Tables 1 to 3 show data for the reduction of the radial internal clearance on different roller bearings designed with clearance values according to DIN 620

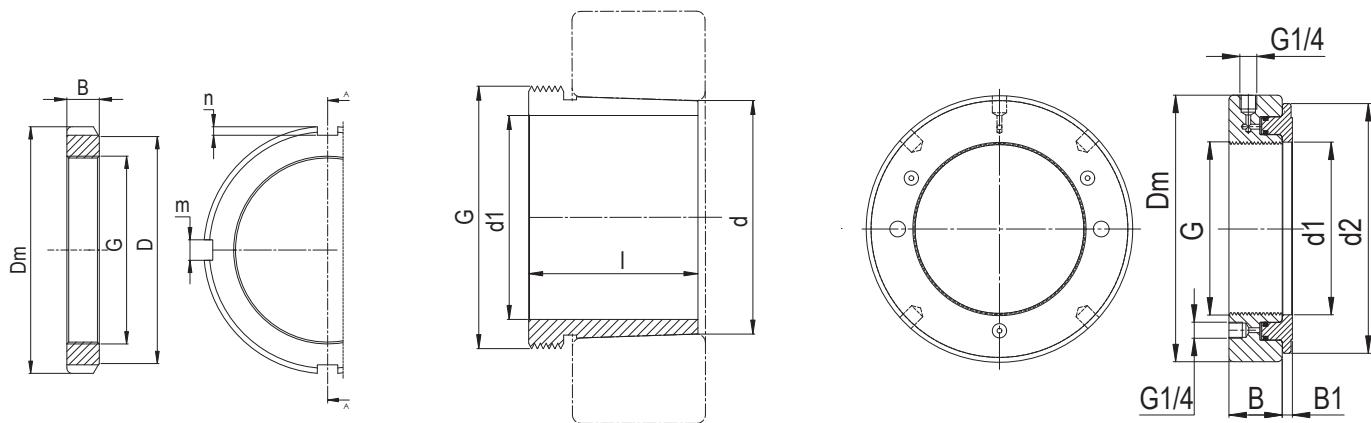

Table 1.

Reduction in radial internal clearance of spherical rolling bearings with tapered bore.

1) Applies only to solid steel shafts and hollow shafts with a bore no larger than half the shaft diameter.

Note: Bearings with a radial internal clearance before fitting in the upper half of the tolerance range are fitted using the larger value for the reduction in radial internal clearance or the axial displacement distance, while bearings in the lower half of the tolerance range are fitted using the smaller value for the reduction in radial internal clearance or the axial displacement distance.

2) The actual value of the radial internal clearance must not be smaller than the control value. In the case of bearings with a small diameter, this may be difficult to determine.

1) Applies only to solid steel shafts and hollow shafts with a bore no larger than half the shaft diameter.

Note: Bearings with a radial internal clearance before fitting in the upper half of the tolerance range are fitted using the larger value for the reduction in radial internal clearance or the axial displacement distance, while bearings in the lower half of the tolerance range are fitted using the smaller value for the reduction in radial internal clearance or the axial displacement distance.

2) The actual value of the radial internal clearance must not be smaller than the control value. In the case of bearings with a small diameter, this may be difficult to determine.

1.4 Designation System

The designation system is built by three parts:

1- Product type

- H** Adapter sleeve, dimensions as ISO standard, basic design
- HA** Adapter sleeve, dimensions as ISO standard, except the bore, in 1/16 in
- HE** Adapter sleeve, dimensions as ISO standard, except the bore, in 1/4 in
- HS** Adapter sleeve, dimensions as ISO standard, except the bore, in 1/8 in
- OH** Adapter sleeve, dimensions as ISO standard, prepared for oil injection
- OSNP** Adapter sleeve, dimensions as ISO standard, prepared for oil injection, with a locking plate
- OSNW** Adapter sleeve, dimensions as ANSI standard, prepared for oil injection
- SNP** Adapter sleeve, dimensions as ANSI standard, with a locking plate
- SNW** Adapter sleeve, dimensions as ANSI standard, with a lock washer
- KH** Unthreaded sleeve, basic design
- KOH** Unthreaded sleeve prepared for oil injection.

2- Size Identification

This part is where the numerical digits are placed, to inform the size of the Adapter Sleeve.

3- Suffixes

- B** For adapter sleeves for oil injection: One or two oil supply ducts at the end opposite the threaded section
- D** Sleeve split in two halves
- E** Adapter sleeve without key slot, with a KMFE lock nut or standard adapter sleeve with an HME lock nut. This option is recommended for CARB toroidal roller bearings and for sealed bearings
- EH** Adapter sleeve without key slot, with a KMFE H lock nut. This option is recommended sealed bearings
- EL** Adapter sleeve without key slot, with a KMFE L lock nut. This option is recommended sealed bearings
- G** Thread diameter changed according to revised ISO standard
- H** One oil supply duct at the threaded end
- HB** One or two oil supply ducts at the threaded end
- L** Adapter sleeve with a lock nut with lower cross-sectional height. This option is recommended for CARB toroidal roller bearings and for sealed bearings
- TL** Same as L, but with key slot positions for a locking clip. This option is recommended for CARB toroidal roller bearings and for sealed bearings.

Precision Nuts

They are used in bearings fixation in machinery and equipment that require high precision. They have shaft tightened and angularly distributed three brass pins around its circumference. Precision Nuts are not subject to axial loads or deformation given that the pins are machined to match the shaft thread and its inclination is equal to the nut thread angle, giving it an exact locking position. These nuts can be used in motors, spindle, lathes, grinders, milling machines, shut-off valves, and ball screws.
